Commission Staff:

Here is the additional information for completeness to our application process;

* The trench for the powerline will be 3' deep by 1' wide for the "primary" [off the power source pole to the transformer.] The trench will be 2' deep by 1' wide for the "secondary" [from the transformer to the house.]

* The roofing material on the addition will be natural cedar shakes to match the existing roof.

* The size of the addition will be 10' by 10'. [the 14' by 14' is incorrect]

* The powerline will follow an old access road originally cut to put in PUD and PP&L lines and poles and BPA towers and transmission lines. No substantial trees will be disturbed, just deer brush, Oregon grape, wild rose and lots of poison oak. It will then follow our driveway to the transformer. The secondary powerline comes up the front lawn made up of native and planted grasses, Oregon grape and our flower and vegetable beds.

The addition is going in the area of pathways made of riverstone and planted with domestic bleeding hearts, irises, spirea, budelia, and columbine. I will move the plants over some and transplant around the addition when completed.

*Finally, we do not have any information regarding when the original house was built. We did get all the necessary title insurance and deeds and tax documents that show the existing structure when we purchased it in 1991.

* I have marked the 50' buffer on the map with a dashed line along the seasonal creek.

Sincerely,
Ms. Michael Stewart and Donald Stewart
