

Dear Commissioners and Staff,

Action needs to be taken to enforce and create rules about how to deal with Climate Change in our beautiful gorge!

Thank you for taking the first step toward addressing climate change by proposing the future development of a climate action plan. However, climate adaptation and mitigation policies are necessary now to fulfill the purposes of the National Scenic Area Act and protect fish, wildlife, sensitive plants, and human health in the Gorge.

For example, stream buffers in the General Management Area were adopted more than 30-years ago and are inadequate for providing protection of critical habitat for endangered salmon. Salmon habitat protection in the Special Management Areas and on federal forest lands is far more protective and is based on the best available science. Management recommendations for stream protection developed by the Washington Department of Fish and Wildlife that apply elsewhere in Washington are far more protective than the minimal stream buffers that apply in large areas of the National Scenic Area.

Dwellings continue to be allowed small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Thank you for considering these comments.

Sincerely,  
Susan Palmiter

Dear Commissioners and Staff,

Thank you for your willingness to address climate change in your plans.

Please prioritize adopting a climate action plan now. An imperfect plan adopted now can be amended and improved in the future. Taking no action now will be harder to remedy.

Steps to include would be to limit development within the scenic areas boundary, prohibit conversion of forest areas to agricultural uses, increase protective buffers around sensitive habitat, and adopt higher energy efficiency standards for any new residential construction.

Thank you,

Chris Eykamp

Sincerely,  
Christopher Eykamp

Dear Commissioners and Staff,

Thank you for taking the first step toward addressing climate change by proposing the future development of a climate action plan. However, climate adaptation and mitigation policies are necessary now to fulfill the purposes of the National Scenic Area Act and protect fish, wildlife, sensitive plants, and human health in the Gorge.

For example, stream buffers in the General Management Area were adopted more than 30-years ago and are inadequate for providing protection of critical habitat for endangered salmon. Salmon habitat protection in the Special Management Areas and on federal forest lands is far more protective and is based on the best available science. Management recommendations for stream protection developed by the Washington Department of Fish and Wildlife that apply elsewhere in Washington are far more protective than the minimal stream buffers that apply in large areas of the National Scenic Area.

Dwellings continue to be allowed small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Unfortunately, we are running out of time to save the endangered salmon, and the orcas who need them for their own survival.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Thank you for considering these comments.

Sincerely,  
Susan McRae

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Thank you for considering these comments.

Sincerely,  
Merna Blagg  
1410 Z St  
Vancouver, WA 98661

Dear Commissioners and Staff,

Thank you for taking the first step toward addressing climate change by proposing the future development of a climate action plan. However, climate adaptation and mitigation policies are necessary now to fulfill the purposes of the National Scenic Area Act and protect fish, wildlife, sensitive plants, and human health in the Gorge.

For example, stream buffers in the General Management Area were adopted more than 30-years ago and are inadequate for providing protection of critical habitat for endangered salmon. Salmon habitat protection in the Special Management Areas and on federal forest lands is far more protective and is based on the best available science. Management recommendations for stream protection developed by the Washington Department of Fish and Wildlife that apply elsewhere in Washington are far more protective than the minimal stream buffers that apply in large areas of the National Scenic Area.

Dwellings continue to be allowed small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Dear Commissioners and Staff,

Thank you for taking the first step toward addressing climate change by proposing the future development of a climate action plan. However, climate adaptation and mitigation policies are necessary NOW to fulfill the purposes of the National Scenic Area Act and protect fish, wildlife, sensitive plants, and human health in the Gorge.

Continuing to stick your head in the sand and spout happy talk and future "maybe" plans will NOT help at all. Time has run out. START FIXING THIS SHIT NOW, it is the ONLY chance we have.

For example, stream buffers in the General Management Area were adopted more than 30-years ago and are inadequate for providing protection of critical habitat for endangered salmon. Salmon habitat protection in the Special Management Areas and on federal forest lands is far more protective and is based on the best available science. Management recommendations for stream protection developed by the Washington Department of Fish and Wildlife that apply elsewhere in Washington are far more protective than the minimal stream buffers that apply in large areas of the National Scenic Area.

Dwellings continue to be allowed small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Thank you for considering these comments.

Sincerely,  
Kelly McConnell

Dwellings continue to be allowed small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Thank you for considering these comments.

Sincerely,  
Ben Asher  
900 NE 81st Ave

Dear Commissioners and Staff,

Thank you for taking the first step toward addressing climate change by proposing the future development of a climate action plan. However, climate adaptation and mitigation policies are necessary now to fulfill the purposes of the National Scenic Area Act and protect fish, wildlife, sensitive plants, and human health in the Gorge.

For example, stream buffers in the General Management Area were adopted more than 30-years ago and are inadequate for providing protection of critical habitat for endangered salmon. Salmon habitat protection in the Special Management Areas and on federal forest lands is far more protective and is based on the best available science. Management recommendations for stream protection developed by the Washington Department of Fish and Wildlife that apply elsewhere in Washington are far more protective than the minimal stream buffers that apply in large areas of the National Scenic Area.

Dwellings continue to be allowed small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Thank you for considering these comments.

Portland, OR 97203

Dear Commissioners and Staff,

Thank you for taking the first step toward addressing climate change by proposing the future development of a climate action plan. However, climate adaptation and mitigation policies are necessary now to fulfill the purposes of the National Scenic Area Act and protect fish, wildlife, sensitive plants, and human health in the Gorge.

For example, stream buffers in the General Management Area were adopted more than 30-years ago and are inadequate for providing protection of critical habitat for endangered salmon. Salmon habitat protection in the Special Management Areas and on federal forest lands is far more protective and is based on the best available science. Management recommendations for stream protection developed by the Washington Department of Fish and Wildlife that apply elsewhere in Washington are far more protective than the minimal stream buffers that apply in large areas of the National Scenic Area.

Dwellings continue to be allowed small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Thank you for considering these comments.

Sincerely,  
Marguery Zucker  
1966 Orchard St

Dwellings continue to be allowed in small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Thank you for considering these comments.

Sincerely,  
stephen couche

Portland, OR 97202

Dear Commissioners and Staff,

Thank you for taking the first step toward addressing climate change by proposing the future development of a climate action plan. However, climate adaptation and mitigation policies are necessary now to fulfill the purposes of the National Scenic Area Act and protect fish, wildlife, sensitive plants, and human health in the Gorge.

For example, stream buffers in the General Management Area were adopted more than 30-years ago and are inadequate for providing protection of critical habitat for endangered salmon. Salmon habitat protection in the Special Management Areas and on federal forest lands is far more protective and is based on the best available science. Management recommendations for stream protection developed by the Washington Department of Fish and Wildlife that apply elsewhere in Washington are far more protective than the minimal stream buffers that apply in large areas of the National Scenic Area.

Dwellings continue to be allowed small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.

Hood River, OR 97031

Dear Commissioners and Staff,

Thank you for taking the first step toward addressing climate change by proposing the future development of a climate action plan. However, climate adaptation and mitigation policies are necessary now to fulfill the purposes of the National Scenic Area Act and protect fish, wildlife, sensitive plants, and human health in the Gorge.

For example, stream buffers in the General Management Area were adopted more than 30-years ago and are inadequate for providing protection of critical habitat for endangered salmon. Salmon habitat protection in the Special Management Areas and on federal forest lands is far more protective and is based on the best available science. Management recommendations for stream protection developed by the Washington Department of Fish and Wildlife that apply elsewhere in Washington are far more protective than the minimal stream buffers that apply in large areas of the National Scenic Area.

Dwellings continue to be allowed small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Thank you for considering these comments.

Sincerely,  
Corinne McWilliams  
6325 NE Lessard Rd  
Camas, WA 98607

Dear Commissioners and Staff,

Thank you for taking the first step toward addressing climate change by proposing the future development of a climate action plan. However, climate adaptation and mitigation policies are necessary now to fulfill the purposes of the National Scenic Area Act and protect fish, wildlife, sensitive plants, and human health in the Gorge.

For example, stream buffers in the General Management Area were adopted more than 30-years ago and are inadequate for providing protection of critical habitat for endangered salmon. Hello,

Below is my written testimony about climate change for the Gorge Commission meeting. Thank you!

- Lyric Emmons

Thank you for recognizing that there is a need to develop a climate action plan for the future in order to protect the National Scenic Area. Though in order to protect the health of inhabitants of the Gorge, including fish, wildlife, sensitive plants, and us, it is vital that we develop climate adaptation and mitigation policies *now*, and put climate change in the forefront of Management Plan review.

Our climate is changing rapidly, and we can not afford to delay taking action any longer. Rising temperatures are increasing water and air temperatures, and causing droughts. Droughts and prolonged dry seasons are intensifying wildfires, and reducing water quality. Invasive species will flourish, and take over the native plants, affecting the local wildlife.

Please, take action, and adopt these climate adaptation policies to alleviate these impacts.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Thank you for considering these comments.

Dear Commissioners and Staff,

Meaningful action on climate change NOW. Preserve Nature and sequester carbon. Please be good stewards rather than absentee landlords.

Sincerely,  
Emily Herbert

Salmon habitat protection in the Special Management Areas and on federal forest lands is far more protective and is based on the best available science. Management recommendations for stream protection developed by the Washington Department of Fish and Wildlife that apply elsewhere in Washington are far more protective than the minimal stream buffers that apply in large areas of the National Scenic Area.

Dwellings continue to be allowed small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Thank you for considering these comments.

Sincerely,

T L

421 NE John Storm Ave  
La Center, WA 98629

Dear Commissioners and Staff,

Thank you for taking the first step toward addressing climate change by proposing the future development of a climate action plan. However, climate adaptation and mitigation policies are necessary now to fulfill the purposes of the National Scenic Area Act and protect fish, wildlife, sensitive plants, and human health in the Gorge.

For example, stream buffers in the General Management Area were adopted more than 30-years ago and are inadequate for providing protection of critical habitat for endangered salmon. Salmon habitat protection in the Special Management Areas and on federal forest lands is far more protective and is based on the best available science. Management recommendations for stream protection developed by the Washington Department of Fish and Wildlife that apply elsewhere in Washington are far more protective than the minimal stream buffers that apply in large areas of the National Scenic Area.

Dwellings continue to be allowed small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.

Dear Commissioners and Staff,

Thank you for taking the first step toward addressing climate change by proposing the future development of a climate action plan. However, climate adaptation and mitigation policies are necessary now to fulfill the purposes of the National Scenic Area Act and protect fish, wildlife, sensitive plants, and human health in the Gorge.

For example, stream buffers in the General Management Area were adopted more than 30-years ago and are inadequate for providing protection of critical habitat for endangered salmon. Salmon habitat protection in the Special Management Areas and on federal forest lands is far more protective and is based on the best available science. Management recommendations for stream protection developed by the Washington Department of Fish and Wildlife that apply elsewhere in Washington are far more protective than the minimal stream buffers that apply in large areas of the National Scenic Area.

Dwellings continue to be allowed small woodland zones without consideration of the increased risk of fire due to climate change. New development is allowed in floodplain areas without consideration of increasing flood events, such as flooding that occurred along the Umatilla River in February.

Please prioritize the following issues in plan review. There should be no delay in adopting these climate adaptation policies.

1. Adopt a climate action plan now to better protect resources. This can always be periodically updated with new information after plan review and revision is completed.
2. Update fish and wildlife habitat protection based on the best available science. This includes expanding protective buffers around salmon-bearing streams and other sensitive wildlife sites.
3. Stop urban expansion and promote growth in existing urban areas boundaries as required by the National Scenic Area Act.
4. Prohibit conversions of forest land to agricultural land.
5. Limit new dwellings within forest zones, especially small woodland zones where new dwellings are currently allowed.
6. Review and revise residential zoning in flood plains considering increased flood risks due to rapid snowmelt and heavier rainfall events.
7. Adopt energy efficiency standards for new dwellings.

Thank you for considering these comments.

Dear Commissioners and Staff,

Thank you for the opportunity to comment to the Gorge Commission.

As Columbia Gorge communities cope with the pandemic and the Forest Service wisely closes recreation areas, now is the time to make pro-active climate decisions. We've seen how climate and Covid are related.

We recommend that the Gorge Commission view climate issues as their top priority.

Cold Water Refuges: The Columbia River tributary streams have been designated by EPA as Cold Water Refuges they provide vital relief and resting areas for upstream migrating steelhead and salmon when Columbia River temperatures become overly warm. The EPA's models show an increase in tributary river temperatures unless measures are taken to at least maintain current temperatures or better, try to reduce temperatures. Forest practices that remove riparian shade trees can increase stream temperatures.

The Sandy River Delta has been a focal point of on the ground climate work that has included the planting of 1.5 million native trees and shrubs and a current experiment of planting regional native climate resilient plants with the goal of 2 million seedlings by 2025. My organization Trees of the Gorge is trying replicate the Delta's planting numbers in the mid-Columbia area and we recommend that Balfour Park and other public Gorge sites become centers for restoration.

Our third recommendation is to protect Oregon white oak through regulatory measures. White oak is considered the most important wildlife tree in both Oregon and Washington, and except for sites with western gray squirrel nests in Washington State, there are no controls on limiting Oregon white oak removal. White oak is also an outstanding climate resilient tree and a species that is well adapted to fire. White oak harbors 200 species of native wildlife in the region.

Thank you for your consideration.  
Sincerely,

Bill and Irene Weiler
